

We first wrote the landing page after that we wrote the login screens for both the producer and the consumer. After making the login pages we made the homepages of the producers and the consumers. On the producer page, producers can see users and the state of their devices and they can add a new device to control for the user. Consumers can control their devices and add another device if it is possible and consumers can see the specifications of their devices on the control screen.

After writing the code for the website we pushed our code to GitHub and lastly we wrote the project workflow report.
